

CHArting Multi-areal Visual Perception in the Mouse

ChampMouse

J. Alexander Heimel

FlagEra Kick-off meeting
Budapest, April 13, 2016

First step of object recognition
Object segregation

Primate and human data

Aim

use a new figure-ground segregation task to chart visual processing in the mouse brain

Objective 1 – Behavioral task

devise a task where head-fixed mice decide if a figure is shown on a background.

Objective 2 – Recording neural activity at multiple scales and areas

measure the neural correlates of figure-ground segregation using electrophysiology and calcium imaging (wide field and 2-photon)

Objective 3 – Interfere with neural processing

determine by optogenetic silencing which areas perform the task.

Objective 4 – Modeling the neural interactions

use our data, with data from Allen Institute and HBP, to create a multi-area, multi-scale model of the mouse visual system

Impact

Better understand visual processing across multiple levels and areas

Links to main aims of HBP

- Perform Targeted Mapping of the Mouse Brain and the Human Brain
- Develop a Multi-Scale Theory for the Brain

Primary interactions with HBP

- HBP Sub-project 1 “Strategic Mouse Brain Data” can guide our modeling of the mouse brain's algorithm to segregate a figure from the background.
- HBP Sub-project 5 “Neuroinformatics” delivering ICT Platforms, tools, Methods and Data Available to the Scientific Community
 - Neuroinformatics platform:
 - Downloading annotated maps of the mouse brain
 - Uploading neural activity using the voxel brain API and ephys data
 - Uploading multiscale model
 - Use 3D viewers to visualize the data
 - HBP Sub-project 5 Brain Simulation Platform
 - Data can be used to feed or validate brain simulations
